The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of apoptosis procein (IAPP). Also included are a peptide or a polypeptide cappotosis procein (IAPP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 N-terminal containing at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by a procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9, which fails to undergo normal processing and possesses wild processing activity, a nucleic acid molecule comprising a polymolectide sequence that encodes the caspase-9 N-terminal linker), and containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to the peptide or polypeptide; in a cell, and a process for the manufacture of a caspase-9-12, inducing apoptosis, in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis and identifying a relation or polypeptides are useful for inducing apoptosis and identifying a relation and peptides or producing as are useful for inducing apoptosis and identifying a relation and peptides are useful for inducing apoptosis and identifying a relation and active and peptides or enhancers of apoptosis and identifying an enhancers of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This is an amino acid sequence variant of human interleukin-1 beta converting enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 polypeptide and agonists to the polypeptide can be used to induce apoptosis, e.g. as an antiviral or antitumour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the CE LAP-6 polypeptide can be used to treat, Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic shock, sepsis, stroke, chronic, acute or central nervous system inflammation, osteoporosis, ischaemia reperfusion injury, cell death associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, apoptosis of endothelial cells in cardiovascular disease, degenerative liver disease, multiple sclerosis, cerebellar degeneration, ischaemic injury, myocardial infarction.

Cardiica immunodeficiency syndrome (AIDS), myelodysplastic syndrome, aplastic anaemia, male pattern baldness and head injury damage. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     271
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   331

The present sequence represents a human Moh6 polypeptide. Moh6 is a ced-3 homologue, and is a member of the ICE (interleukin-1-beta converting enzyme) family of aspartate-specific cysteine proteases (ASCPs). The specification describes a method for identifying mammalian Moh6 activity modulators (inhibitors a method for identifying mammalian Moh6 activity method are useful as pharmaceuticals for treating or preventing diseases characterized by increased apoptotic cell death such as Alzheimer's disease, Parkinson's disease, amyotropic lateral sclerosis, retinitis pigmentosa, or cerebellar degeneration, myelodysplastic syndromes such as and reperfusion injury. The compounds are also useful for treating diseases characterized by loss of apoptotic cell death such as cancers, e.g. lymphomas, carcinomas and hormone dependent tumours such as breast, prostate and ovarian cancer. Increased cell survival or apoptosis
                                                                                                                                                                                                                                                                                               Mch6; ced-3 homologue; ICE; interleukin-1-beta converting enzyme; sapartate specific cysteine protease; ASCP; apoptotic cell death; Alzheimer's disease; Parkinson's disease; amyotropic lateral sclerosis; retinitis pigmentosa; cerebellar degeneration; myelodysplastic syndrome; aplastic anemia; ischemic injury; myocardial infarction; stroke; cancer; reperfusion injury; autoimmune disease; systemic lupus erythomatosus; immune-mediated glomerulonephritis; viral infection; cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying mammalian homolog ced-3 homolog (Mch)6 activity modulators, useful for treating lymphomas, carcinomas and hormone dependent tumors, Alzheimer's disease, Parkinson's disease, comprises using Mch6 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      infections such as herpes virus, pox virus and adenovirus and the novel identified compounds are useful for treating these conditions. The Mch6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inhibition also results in autoimmune diseases such as systemic lupus erythematosus and immune-mediated glomerulonephritis as well as viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibitors are used to treat or to reduce severity of diseases characterized by increased programmed cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 416;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 195; DB 4; Le

```
homologue 6) an aspartate-specific cysteine protease and the MCH6 polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to diagnose, treat (e.g. by gene therapy) or reduce the severity of cell death-mediated diseases (i.e. apoptotic) such as neurodegenerative diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa and cerebellar degeneration, and myelodysplastic syndromes, e.g. aplastic anaemia, ischaemic injury, myocardial infarction, stroke and reperfusion injury. The MCH6-encoding nucleic acids and polypeptides can also be used to diagnose or generate reagents to diagnose diseases mediated or characterised by programmed cell death. A purified recombinant MCH6 protein can be used to measure hydrolysis rates for various substrates such as DEVD-AMC and YVAD-AMC in a continuous fluorometric assay. The present sequence represents human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FFIQACGGEQKDHGFEVASTSPEDESPGSNPEPDATPFQEGLRTFDQLDAISSLPTPSDI 341

The present sequence represents a human apoptotic protease, designated Mch6. Mch6 is an aspartate-specific cysteine protease. Mch6 polypeptides and polynucleotides can be used to diagnose, treat or reduce the severity of cell death-mediated conditions, e.g. cancers, autoimmune diseases such as systemic lupus erythematosus, viral infections such as herpesvirus, disease, myelodysplastic syndromes such as myocardial infarction and stroke. They can also be used to screen for compounds that inhibit or promote Mch6 mediated apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     282 FFIQACGGEQKDHGFEVASTSPEDESPGSNPEPDATPFQEGLRTFDQLDAISSLPTPSDI 341

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated gene encoding apoptic procease, mammalian ced-3 homologue 6 (McD6). Mch6 is a member of the aspartate-specific cysteine procease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating apoptosis (e.g. for treating Alzheimer's disease, Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell deathmediated diseases, as well as other diseases mediated by either increased of decreased programmed cell death. The present amino acid sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·

The invention describes an isolated gene (I) encoding Mch6 (mammalian ced almonogue 6), or a functional fragment of it. (I) And the polypeptide encoded by (I) is used to modulate apoptosis for the therapeutic treatment of human diseases. (I) Is used to prepared a recombinant aspartate-specific cysteine protease, that it encodes. The recombinant protease can be used to screen for Mch6 inhibitors. Disorders involving apoptosis that can be diagnosed or treated by (I) or the polypeptide encodes, including cancers, viral infections, degenerative disorders, each as Althelmers and Parkinsons disease, and myocardial infarction. This is the amino acid sequence of human mammalian ced-3 homologue 6 (Mch6), a member of the aspartate-specific cysteine protease (ASCP)
                                                                                                                                                                                                                                                                                                                                    New isolated gene encoding a mammalian ced-3 homolog 6, for modulating apoptosis for the therapeutic treatment of human diseases, such as cancers and degenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cysteine protease, apoptosis, caspase expression cassette, metastasis, tumour, cathepsin B, urokinase, proliferation, gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           222 ODHGALDCCVVVILSHGCQASHLQFPGAVYGTDGCPVSVEKIVNIFNGTSCPSLGGKPKL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                            The invention relates to determining a prognosis for survival for a cancer patient. The method involves (a) measuring a level of a tumour upcegulated CARD-containing antagonist of caspase-9 (TUCAN) in a neoplastic cell-containing sample from the cancer patient; and (b) comparing the cell-containing sample for a reference level of TUCAN, where a low level of TUCAN in the sample correlates with increased survival of the patient. Alternatively, the method involves measuring levels of TUCAN and one or more biomarkers selected from the group of GIAR2, Apafi, BGI-2, or Smac in a neoplastic cell-containing sample from the cancer patient. The method is useful for determining if the patient is at risk for relapse, or for determining a proper course of treatment for a patient with cancer. The method is also useful for monitoring the effectiveness of a course of treatment for a patient with cancer, e.g. colon cancer, gastrointestinal cancer, breast cancer, ovarian cancer, lung cancer, clenkemia, CNS cancer, melanowa, prosetae cancer, or renal cancer. The present sequence represents a human caspase-9 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            281

Cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion polypeptide is used to identify a mutant cell line deficient in an enzyme of interest and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by overexpression of a polypeptide (e.g. Cathepsin B or unoxinae, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy. Note: This sequence SEQ.ID.NO.18 is stated as being the same as that shown in Figure 18 (See AAE00606) in the specification. However these sequences differ at several
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel fusion polypeptide comprising first and second caspase subunit separated by cleavage site not associated in nature with caspase subunit, useful for cloning gene encoding enzymes involved in proteolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present amino acid sequence is human Caspase-9 also known as interleukin-1 converting enzyme (ICB) LAPS and Moh6. Caspases are a family of cysteine proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by

apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDS, neurodegenerative diseases,

ischaemic injury, cancer, autoimmune diseases. The present sequence represents the caspase-9 protein mutated to ablate the autocatalytic cleavage site in the linker region. Note: the present sequence is not

ADAl0677 standard; protein; 401 AA.

RESULT 14 ADA10677 ID ADA

comprising at least an N terminus sequence of caspase-9 N-terminal linker sequence, a first portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide or polypeptide exhibits caspase-3, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP birst domain) or at least a portion of a mutated by core polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP birst domain) or at least a portion of a mutated by comparatic activity, an uncleic acid molecule comprising a polymucleotide sequence that encodes the caspase-9 N-terminal linker), an expression vector comprising any of the nucleic acid, a host cell containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to a epitope located on the N-terminus of a caspase-9-p12, inducing apoptosis or a neoplastic or tumour cell, and epitope located on the N-terminus of a caspase-9-p12, inducing apoptosis or a neoplastic or tumour cell, and cell or stimulating apoptosis in a neoplastic or tumour cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inhibit and compound the apoctosis or enhancers of apoptosis for treating ADDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. New nucleic acid molecules encoding a peptide or polypeptide that binds to a portion of an inhibitor of apoptosis protein, useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDS, or cancer.

Claim 38; Page; 52pp; English.

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of appropriate geothers, of approach of an inhibitor of appropriate geothers, a first portion of a procaspase-9 N-terminal linke at least an N terminus sequence of caspase-9 N-terminal linke at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and lacks cysteine containing a mutated active site, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP Bird aboration of a mutated containing or at least a portion of caspase-3, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP Bird admain) or at least a portion of a mutated containing an IAP Bird admain) or at least a portion of a mutated contained by contained the fails to undergo normal processing and possesses wild type caspase-9, which fails to undergo normal processing and possesses wild contained sequence that encodes the caspase-9 hard a linker), an an analysis of the caspase-1 inker) and an analysis of the caspase-1 inker). Containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to an epitope located on the N-terminus of a caspase-g-pl2, inducing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, can inhibitor or enhancer of caspase-mediated apoptosis, identifying a compound that inhibits the peptide or polypeptide, containing a compound for inhibiting or enhancing a process for the manufacture of a compound for inhibiting or enhancing a process for the manufacture of a compound for inhibiting or enhancing containing a cell, and a cell, intermination or enhancer of a compound for inhibiting or enhancing or enhancers of apoptosis for treating apoptosis and identifying inhibitors or enhancers of apoptosis for treating apoptosis and identifying inhibitors or enhancers of apoptosis for treating apoptosis. The present sequence can be considered to ablate the autocatalytic represents the caspase-g protein mutated to ablate the autocatalytic cleavage site in the linker region. Note: the present sequence is not shown in the specification but was created by the indexer using the conformation in the claims and the wild type caspase-g sequence.

Claim 36; Page; 52pp; English.

The inversion traces to an instruct cure necessary and properties that specifically binds to at least a portion of an inhibitor of that specifically binds to at least a portion of an inhibitor of comprising at least an N terminus sequence of caspase-9 N-terminal links sequence, a first portion of a procaspase-9 that specifically binds at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide specifically binds at least a portion of an IAP and lacks cysteine specifically binds at least a portion of an IAP and lacks cysteine protease activity, and at least a portion of caspase-3, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP or an IAP Bir3 domain) or at least a portion of a mutated correspase-9, which fails to undergo normal processing and possesses wild type caspase-9 enzymatic activity, a nucleic acid molecule comprising a polymolecide sequence that encodes the caspase-9 had possesses of the caspase-9 enzymatic activity, a nucleic acid molecule comprising a polymolecide sequence that encodes the caspase-9 had possesses wild the caspase-9 enzymatic activity, a nucleic acid molecule comprising a polymolecide sequence. producing a compound for inhibiting or enhancing apoptosis in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or expression vector comprising any of the nucleic acids, a host cell containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to an epitope located on the V-terminus of a caspase-9-pl2, inducing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, identifying an inhibitor or enhancer of caspase-mediated apoptosis, identifying a compound that inhibits the peptide or polypeptide, The invention relates to an isolated nucleic acid molecule comprising a

                                                                                                                                                                                                                                                                                                                            216
polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AlDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence represents the caspase-9 protein mutated to ablate the autocatalytic cleavage site in the linker region. Note: the present sequence is not shown in the specification but was created by the indexer using the information in the claims and the wild type caspase-9 sequence.
                                                                                                                                                                                                                                                                                                                                               MEPCGHCLIINNVNFCRESGLRTRTGSNIDCEKLRRRFSSLHFMVEVKGDLTAKKMVLAL 216

```

The invention relates to an isolated intracellular signaling polypeptide, termed Nod2, comprising a sequence of 1007 or 1040 amino acids, given in the specification. The nucleic acid encoding the isolated protein is useful for identifying subjects at risk of developing Crohn's disease by providing a nucleic acid from the subject, where the nucleic acid comprises a Nod2 gene, and detecting the presence or absence of one or more variations in the Nod2 gene. Detecting comprises comparing the

                                                                                                     preferably a cytosine residue insertion, where the mutation causes a deletion of a Leu-Arg-Arg repeat of Nod2. The variation results in increased nuclear factor (NF)-B activation. The variation is selected from the sequences of the Nod2 gene. The isolated protein is useful as a target for screening drugs that can alter, for example, RICK signaling, and thus the physiological effects of NF-kappa B. The Nod2 gene is useful for producing the isolated protein by recombinant techniques, as starting nucleic acids for directed evolution, for gene therapy, or to decrease the level of Nod2 protein or mRNA in transgenic plants, plant tissues, or plant cells as compared to wild-type plants, plant tissues or plant cells. This sequence represents a Nod2 related protein of the invention
a wild-type Nod2 nucleic

sequence of the nucleic acid to the sequence of a wild-type Nod2 nuclei acid. Detection is accomplished by hybridisation analysis. The method further comprises determining if the subject is at risk of developing Crohn's disease based on the presence or absence of the variations, and determining a genotype relative risk or a population attributable risk for the subject. The variation is a polymorphism or a mutation.

homologue in the cell. The BTF3 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death. The screened agent that increases or inhibits programmed cell death. The for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease or multiple sclerosis, atherosclerosis, or rheumatoid arthritis. Sequences ABP71124-135 represent peptide fragments various CARD proteins

New nucleic acid molecules encoding a peptide or polypeptide that binds to a portion of an inhibitor of apoptosis protein, useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for (UYJE-) UNIV JEFFERSON THOMAS 06-FEB-2002; 2002US-00068569, 08-FEB-2001; 2001US-0267966P. 24-AUG-2001; 2001US-00939293. treating AIDS, or cancer WPI; 2003-219992/21 US2002160975-A1. 31-OCT-2002. Alnemri ES;

The invention relates to an isolated nucleic acid molecule comprising a polynucleocide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of apoptosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 hat specifically binds at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide specifically binds at least a portion of an IAP and lacks cysteine protease activity, and at least a portion of caspase-3, where the peptide or polypetide or polypetide exhibits caspase-3 enzymatic activity that is inhibited by an IAP or an IAP Bir3 domain) or at least a portion of a mutated

Example 1; Fig 1; 52pp; English.

                                                                            containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to epitope located on the N-terminus of a caspase-pp12, inducing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, identifying an inhibitor or enhancer of caspase-mediated apoptosis, producing a compound that inhibits the peptide or polypeptide, producing a compound that inhibits or enhancing apoptosis in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or enhancing apolypeptides are useful for inducing apoptosis in a cell. The nucleic acid molecules and identifying inhibitors or enhancers of apoptosis for tracting AIDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence
procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9 enzymatic activity, a nucleic acid molecule comprising a polynucleotide sequence that encodes the caspase-9 N-terminal linker), an expression vector comprising any of the nucleic acids, a host cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          caspase-9; anti-HIV; nootropic; neuroprotective; vasotropic; cytostatic; immunosuppressive; inhibitor of apoptosis protein; IAP; caspase-9 N-terminal linker; processpase-9; cysteline protease; caspase-3; Bir3 domain; apoptosis; AIDS; neurodegenerative disease; ischaemic injury; cancer; autoimmune disease; human.

                          The invention relates to inhibiting or increasing programmed cell death of a cell. The method involves upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BFF) or its homologue in the cell. The BTF9 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death. The screened agent that increases or inhibits programmed cell death. The for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, altheimer's disease, Parkinson's disease or multiple sclerosis), atherosclerosis, or rheumatoid architis. Sequences ABP71106-123 represent CARD regions of various CARD proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules encoding rev-caspases. Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal, to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In virco translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid molecule encoding a rev-caspase - used for screening and identifying inhibitors or enhancers for treating cancer or

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating dapoptosis (e.g. for treating dapoptosis or parkinson's disease or crebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell deathmediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's disease.
for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAY21734 -AAY21795 represent conserved peptide sequences in various

New nucleic acid molecules encoding a peptide or polypeptide that binds to a portion of an inhibitor of apoptosis protein, useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for

treating AIDS, or cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polymucleotides encoding an Omi (serine protease) peptide or polypeptide. The Omi peptide specifically binds to a portion of an Inhibitor of Apoptosis Protein (IAP). The Omi polypeptide induces caspase-independent apoptosis, or fails to have serine protease activity. The Omi peptides are useful for regulating or altering activity. The Omi peptides are useful for regulating or altering apoptosis, specifically caspase-mediated apoptosis, and as immunogens for raising antibodies. Enhancers of apoptosis are useful for treating cancers, tumours or for destroying cells that mediate autoimmune diseases. Compositions may also be used for the treatment of diseases compositions may also be used for the treatment of diseases cused in isolating Omi peptides, polypeptides and their variants, in identifying molecules that interact with Omi peptides and polypeptides and in inhibiting or enhancing the biological activity of Omi peptides and bolypeptides. Sequences ABPP1310-315 represent fragments of various can be inding proteins, used to determine Omi as a IAP-binding proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·

```
The invention relates to an isolated mulcied acid molecule comprising a polymucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to a least a portion of an inhibitor of apoptosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 that specifically linker sequence, a first portion of a procaspase-9 that specifically binds at least an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide expicially binds at least a portion of an IAP and lacks cysteine protease activity, and at least a portion of an IAP and lacks cysteine protease activity, and at least a portion of an IAP and lacks cysteine procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9 perzymatic activity, a nucleic acid molecule comprising a polymucleotide sequence that encodes the caspase-9 N-terminal linker), an expression vector comprising any of the nucleic acid molecule comprising a polymucleotide sequence that encodes the caspase-9 N-terminal linker), and expression vector comprising any of the nucleic acids, a host cell containing the expression vector, an antibody that specifically binds to an epitope located on the N-terminus of a caspase-9-pl2, inducing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, and epitide or polypeptide, an antibody that specifically binds to dentifying a compound that inhibiting or enhancing apoptosis in a cell or stimulating apoptosis in a neoplastic or polypeptide or polypeptide for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inhibiting or enhancing apoptosis for treating ADS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence correpresents the N-terminus of an IAP prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               caspase-9; anti-HIV; nootropic; neuroprotective; vasotropic; cytostatic; immunosuppressive; inhibitor of apoptosis protein; IAP; caspase-9 N-terminal linker; procaspase-9; cysteine protease; caspase-3; Bir3 domain; apoptosis; AIDS; neurodegenerative disease;

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of a poptosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 N-terminal linker sequence, a first portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide expitits caspase-3 enzymmatic activity that is inhibited by an IAP or an IAP Bir3 domain) or at least a portion of a mutated or polypeptide exhibits caspase-3 enzymmatic activity that is inhibited by an IAP or an IAP Bir3 domain) or at least a portion of a mutated or procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9 enzymatic activity, a mucleic acid molecule comprising a polynucleotide sequence that encodes the caspase-9 N-terminal linker), an expression vector comprising any of the nucleic acids, a host cell containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to contain a coll or stimulating apoptosis in a neoplastic or tumour cell, in a cell or stimulating apoptosis in a neoplastic or tumour cell, dentifying an inhibitor or enhancer of caspase-9-ply appropriacion a compound that inhibits the peptide or polypeptide. The manufacture of a compound for inhibiting or enhancing apoptosis in a reall or the manufacture of a compound or enhancing anothers in a reall or the manufacture of a compound to a manufacture of a compound anothers in a cell or enhanced or a process for the manufacture of a compound anothers are des
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         apoptosis in a cell. The mucleic acid molecules and peptides or Dypertides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AlDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence represents the N-terminus of an IAP protein containing a Bir3 domain.
ischaemic injury; cancer; autoimmune disease; Human; p12 subunit.

New nucleic acid molecules encoding a peptide or polypeptide that binds to a portion of an inhibitor of apoptosis protein, useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDS, or cancer.
```

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell deathediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's Example 1; Fig 2; 36pp; English. disease.

The present invention relates to oligonucleotides (see AAL26793-AAL34659)

encoding polymorphic variants of proteins related to amylases, amyloid
properties, anglopoletria, apoptosis related proteins, cadherin, cyclin,
polymerase, oncogenes, histones, kinases, colony stimulating factors,
complement related proteins, cytochromes, kinesins, cytokines,
interferons, interleukins, G-protein coupled receptors and thioesterases.
The present sequence is a peptide encoded by one such oligonucleotide.
The oligonucleotides and the peptides encoded by them may be used in the
prevention, diagnosis and treatment of diseases associated with
chaptopriate expression of the proteins listed above. Disorders that may
be prevented, diagnosed and/or treated include multifactorial diseases
with a genetic component, such as autoimmune diseases (e.g. rheumatoid
arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus
arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus
can disease, colon and kidney, leukaemia), diseases of the nervous
system and an infection of pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neuroprotective; anti-Parkinsonian; antianaemic; vasotropic; cardiant; cerebroprotective; mammalian ced-3 homologue 6; gene therapy; apoptosis; cerebroprotective; mammalian ced-3 homologue 6; gene therapy; apoptosis; cerebrilar degeneration; myelodysplastic syndrome; aplastic anaemia; ischaemic injury; myocardial infarction; stroke; reperfusion injury; amyotrophic lateral sclerosis; conserved sequence.
                                                                                                                                                                                                                                                                                                Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; aspartate-specific cysteine protease; MCH6; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 14; DB 4; Length 14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an isolated gene (I) encoding Work (mammalian ced -3 homologue 6), or a functional fragment of it. (I) And the polypeptide encoded by (I) is used to modulate apoptosis for the therapeutic treatment of human diseases. (I) Is used to prepared a recombinant aspartate-specific cysteine protease, that it encodes. The recombinant apoptosis can be used to screen for Moh6 inhibitors. Disorders involving apoptosis that can be diagnosed or treated by (I) or the polypeptide it encodes, including cancers, viral infections, degenerative disorders, each as Albabeimers and Parkinsons disease, and myocardial infarction. This is the amino acid sequence of a human aspartate-specific cysteine protease (ASCP) fragment used in a comparison with other ASPC family

The invention relates to an isolated gene encoding MCH6 (mammalian ced-3 homologue 6) an aspartate-specific cysteine protease and the MCH6 polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to diagnose, treat (e.g. by gene therapy) or reduce the severity of cell death-mediated diseases (i.e. apoptotic) such as neurodegenerative diseases e.g. Alzheiner's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa and cerebellar degeneration, and myocardial infarction, stroke and reperfusion injury. The MCH6-encoding nucleic acids and polypeptides can also be used to diagnose or generate contacts to diagnose diseases mediated or characterised by programmed cell death. A purified recombinant WCH6 protein can be used to measure dydrolysis rates for various substrates such as DEVD-AMC and YVAD-AMC in conserved sequence from human MCH6 in the MCH6 is a member of the conserved sequence from the more from the more conserved sequence from the more conserved sequence from the more conserved sequence from the more from the more conserved sequence from the more from the more conserved sequence from the conserved sequence from the conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Caspase-1; Spodoptera frugiperda; Sf; insect; nuclear immunophilin;
CED-3 subfamily; aspartate-specific cysteine protease; ASCP; apoptosis.
                                                                                                                                                                                                                                                   New Mch6 polypeptides and genes encoding the polypeptides useful for diagnosing, treating or reducing the severity of cell death-mediated diseases such as neurodegenerative diseases e.g. Alzheimer's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2.9%; Score 12; DB 4; Length 15;

This represents a Caspase-1 pro-enzyme, a novel Spodoptera frugiperda (Sf) insect cell nuclear immunophilin which belongs to the CED-3 subfamily of aspartate-specific cysteine proteases (ASCPs). A host cell containing an expression vector comprising the Caspase-1 nucleic acid can be used for the recombinant production of the protein. The products can a cativity and which can be used to inhibit or enhance (aspase-1 activity and which can be used to inhibit or enhance, respectively, appoptosis. The Caspase-1 can also be used to identify proteins which are processed by it. The products can also be used for the production of antibodies and for the production of transgenic animals
                                                                                                                 Isolated aspartate-specific cysteine protease, Caspase-1 - obtained from Spodoptera frugiperda, used to develop screening assays for compounds which can inhibit or enhance apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737 Particle data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The method involves upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BFF) or its homologue in the cell. The BTF3 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death or pre-screening for an agent that modulates programmed cell death, is used for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease or multiple sclerosis), atherososlerosis, or theumatoid arthritis. Sequences ABP71106-123 represent CARD regions of various CARD proteins

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.

Claim 27; SEQ ID NO 27772; 634pp; English

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 1287 open reading fraames derived from the 12614 complements or the 12887 open reading fraames derived from the 12614 complements or the 12887 open reading fraames derived from the 12614 complements or the bunan lung; measuring set high stringency to a nucleic derived from human lung; measuring set high stringency to a nucleic carid expressed in the bunan lung; measuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the carray; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe, the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exons in several in the above mentioned microarray; assigning exons to a single exon probe, above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon compression of the exons in the tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising of 12011 sequences, mentioned in the specification, or encoded by the cyposes, or of the exons in the tissues and/or cell types using hybridisation or each of probe exon company to the exons in a gene particularly using human collection of the exons in a gene particularly in the expression of the exons in the expression of the exons in the expression of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary hemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention. Note: The sequence data for this patent did not the printed specification, but was obtained in electronic for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rinted specification, but was obtained in electronic for

```
New gene encoding Mch3, a cysteine protease that regulates apoptosis - for treating human diseases associated with apoptosis, and screening for antagonists and agonists of Mch3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human Mch3-alpha (AAW15262) is an apoptotic protein and novel member of the interleukin-1-beta converting enzyme (ICE) family of cysteine proteases. Its amino acid sequence was deduced from a CDNA clone (AAT66992) obtd. from a Jurkat library. Mch3-beta (AAW15263) has also been identified that lacks the active site of Mch3-alpha. Mch3-alpha polypeptides can be produced in engineered host calls and used to treat human diseases associated with cell death, such as AIDS, ischaemic injury, neurodegenerative diseases, etc. They can also be used to regulate apoptosis and to screen for Mch3 agonists and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

                                                                                                                                                                                                                                                                                                                                                                                                                                   A proenzyme (AAW15247) is activated to CMH-1, or CPP32/Mch2 homologue-1, a human cysteine procease that is involved in apoptosis. Its amino acid sequence was deduced from a full-length isolated CDNA clone (ART66970). Active, activatable (i.e. proenzyme) or inactivated forms of CMH-1 can be expressed in prokaryotic or enkaryotic host cells. The polypeptides are useful for screening potential apoptosis inhibitors and for raising antibodies used to assay CMH-1, to regulate cholesterol levels, inhibit CMH-1 activity and therefore apoptosis, and to purify CMH-1 polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rev-caspase; cysteine protease; zymogen; caspase; cancer; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                        DNA encoding active, activatable or inactive cysteine protease CMH-1 - useful in gene therapy for promoting and inhibiting apoptosis and for diagnosing cells with potential for apoptosis.

Rev-caspases are cysteine proteases that specifically cleave proteans after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, caspase-7; interleukin-1 converting enzyme; ICE-1AP3; CHM-1; Mhc3; cysteine protease; apoptosis; caspase expression cassette; metastasis; tumour; cathepsin B; urokinase; proliferation; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid molecule encoding a rev-caspase - used for screening and identifying inhibitors or enhancers for treating cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid molecules encoding rev-caspases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2.4%; Score 10; DB 2; Length 303; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present amino acid sequence is human Caspase-7 also known as interleukin-1 converting enzyme (ICE) LAP3, CHW-1 and Mhd3. Caspases are a family of cysteine profeases, that participate in the initiation and execution of apoptosis. Caspases sist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific agpartic acid residues within the pro-enzymes sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, caspase subunit, separated by a cleavage site not associated in nature, caspase. An expression cassette containing fusion polypeptide is used to identify a mutant cell line deficient in an enzyme of interest and is also useful for diagnosis and suppression of a polypeptide (e.g. cate tumour cell characterised by overexpression of a polypeptide (e.g. categorism B or urokinase, selectively expression of a polypeptide is used to encoding fusion polypeptide is used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                              Novel fusion polypeptide comprising first and second caspase subunit separated by cleavage site not associated in nature with caspase subunit, useful for cloning gene encoding enzymes involved in proteolytic

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and sa ninhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 expression. (I) is usesciated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or research reagent and kits. (I) is useful prophylactically to prevent or represents a mouse caspase 7 protein, which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .,

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is

tissues, and for treating a human having adjease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as delay infection, inflammation or tumour formation. The present sequence the present invention or tumour formation. The present sequence the present invention
                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (1) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human caspase 7 protein, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention describes a compound (I) 8-50 nucleobases in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7.

                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a bacteriophage preparation, comprising a bacteriophage modified to enter eukaryotic cells, which is lytic to pathogenic bacterial strain infecting the cell, and is capable of expressing an annihilation moiety. Said moiety will then cause the death or inactivation of an infected cell. In particular, the preparation can be used to kill cells infected with tuberculosis, HIV, AIDS and malaria. The present sequence is a protein produced by a DNA fragment used to produce the modified bacteriophage of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacteriophage preparation for stimulating death of infected cell, has bacteriophage that enters cell and lyses pathogenic bacteria that infect cells, linked to annihilation moiety that stimulates death of infected
                                                                                                                                                                                                                                                                                                                                                Bacteriophage; lytic; pathogenic bacterium; phage; annihilation moiety; infection; tuberculosis; AIDS; HIV infection; malaria; mutagenic; tuberculostatic; anti-HIV; virucide; protozoacide; antibacterial.

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176, ABL30511), expressed DNA sequences (ABL01840-ABL30511), expressed DNA ABB2072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and chromatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 expression. (I) is useful for inhibiting a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful for diagnostics, therapeutics, prophylaxis and elebay infection, inflammation or tumour formation. The present sequence represents a human caspase 7 protein, which is used in an example from
                                                                                                                                                                                                                                                                                                                       Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                   Example 15; Page 103-105; 138pp; English.

FUNCTION: Isoform 2 lacks activity is an dominant-negative inhibitor of caspase-9.

SUBUNIT: Heterodimer of a 35 kDa (P35) and a 10 kDa (P10) subunit. Caspase-9 and APAF1 bind to each other via their respective NH2-terminal CED-3 homologous domains in the presence of cytochrome Captarn in the crack with BIRC7.
                                                                                                                          Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).
-! FUNCTION: Involved in the activation cascade of caspases
-! seponsible for apoptosis execution. Binding of caspase-9 to Apaf-
1 leads to activation of the protease which then cleaves and
activates caspase-3. Proteolytically cleaves poly (ADP-ribose)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Name=1; Synonyms=91, Alpha;

J. Biol. Chem. 272-1421-1424(1997)
-1- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution (By similarity). Inhibited by the baculovirus anti-apoptotic protein p35. Cleaves p35 and nuclear immunophilin FKBP46.
                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- PTM: AN AUTOCATALYTIC MECHANISM GENERATES THE TWO ACTIVE SUBUNITS.

DEVELOPMENTAL STAGE: Present uniformly throughout embryos of stages 4 and 10. In stage 16 embryos, the expression becomes restricted to the central nervous system, the developing gonads, and a portion of the gut. In stage 17 embryos, expression is mainly localized in cells along the midline of the central nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STRAIN=Berkeley; TISSUE=Embryo;

-- FUNCTION: Involved in the activation cascade of caspases
responsible for apoptosis execution (By similarity).
Proteolytically cleaves poly(ADP-ribose) polymerase (PARP). Loss
of zygotic DCP-1 function causes larval lethality and melanotic

C -!- FUNCTION: INVOLved in the activation cascade of caspases responsible for apoptosis and lamin DMO in vitro.

C -!- SUBONIT: Heterodimer of a 21 kDa (P21) and a 12 kDa (P12) subunit.

Proc. Natl. Acad. Sci. U.S., 99:16899-16903(2002).

-! FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Cleaves and activates sterol promotes programmed cell death (By similarity).

-! SUBUNIT: Heterodimer of a 20 kDa (p20) and a 11 kDa (p11) subunit.

-! SUBCELLUIAR LOCATION: Cytoplasmic.
                                                                                                                                                                                                                                                                                                         TISSUE-Skeletal muscle;

DISEASE: Defects in CASP10 are the cause of type II autoimmune lymphoproliferative syndrome (ALPS2) [MIM:603909]. ALPS2 is characterized by abnormal lymphocyte and dendritic cell homeostasis and immune regulatory defects.

SIMILARITY: Belongs to peptidase family C14:
SIMILARITY: Contains 2 death effector (DED) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /FTId=VSP_000820,

Proc. Natl. Acad. Sci. U.S.A. 99:9585-9590(2002).

-!- FUNCTION: Receptor with a serine/threonine-protein kinase activity. Regulates, in response to brassinosteroid binding, a signaling cascade involved in plant development, including expression of light- and stress-regulated genes, promotion of cell clongation, normal leaf and chloroplast senescence, and flowering. May be involved in a feedback regulated brassinosteroid biosynthesis. May be also involved in the perception of systemin, a peptide hormone responsible for the systemic activation of defense genes in leaves of wounded plants (By similarity).

-!- CAPALYTIC ACTIVITY: ATP + a protein = ADP + a phosphorotein.
-!- SUBCELLULAR LOCATION: Type I membrane protein; plasma membrane.
-!- MISCELLULAR LOCATION: Type I membrane protein; plasma membrane.
-!- MISCELLULAR is essential for the binding of brassinosteroids (By
                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                 MISCELLANEOUS. BRII is almost identical to SR160, a systemin receptor identified in Lycoperation peruvianum. Competition experiments indicate that brassinosteroid and systemin are probably perceived by different regions of the receptor. SIMILARITY: Belongs to the Ser/Thr family of protein kinases. SIMILARITY: Contains 24 leucine-rich (LRR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        35

MISCELLANBOUGS: SR160 is almost identical to BRII, a MISCELLANBOUGS: SR160 is almost identified in Lycopersicon esculentum. Competition experiments indicate that brassinosteroid and systemin are probably perceived by different regions of the receptor. SIMILARITY: Belongs to the Ser/Thr family of protein Kinases. SIMILARITY: Contains 24 leucine-rich (LRR) repeats.

genome sequence of Chlamydia pneumoniae TW183 and comparison with
         other Chlamydia strains based on whole genome sequence analysis.";
Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases
-!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                              substrates.
CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                          SUBUNIT: The enzyme consists of the sigma chain and the core enzyme which is composed of 2 alpha chains, 1 beta chain, and 1
                                      of DNA into RNA using the four ribonucleoside triphosphates as
                                                                                                      SIMILARITY: Belongs to the RNA polymerase beta' chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STRAIN-TN;

The H protein shuttles the methylamine group of glycine from the P protein to the T protein (By similarity).
-!- COFACTOR: The H chain contains a covalently-bound lipoyl cofactor (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SUBUNIT: The glycine cleavage system is composed of four proteins:
P, T, L and H (By similarity).
-!- SIMILARITY: Belongs to the gcvH family.
-!- SIMILARITY: Contains 1 lipoyl-binding domain.

TISSUE SPECIFICITY: Forebrain and midbrain.
DIVERDOMENTAL STAGE: 18 first detectable at the neural plate stage (stage 14). Levels gradually increase during later neurals stages, and becomes fairly constant throughout tailbud and hatching stages before declining at late swimming tadoole stages.
SIMILARITY: Belongs to the NK-2 homeobox family.
SIMILARITY: Contains 1 homeobox domain.
                                                                                                                                                                                                                                                                                                                                                                                                      developing brain.";
Development 118:193-202(1993).
-!- FUNCTION: Defines dorsal-ventral domains in developing brain. May play a role in defining positional information along the anterior-posterior (a/p) axis and the dorsal-ventral (d/v) axis of the developing nervous system. May be involved in determining positional or boundary information rather than determining a given
